

BRAINSTORM & IDEA PRIORITIZATION TEMPLATE

Date: 31 March 2026

Project Name: Online Complaint Registration and Management System

Step 1: Team Gathering, Collaboration and Select the Problem Statement

Problem Statement: Citizens face significant difficulties when trying to report civic issues such as water leakage, power outages, road damage, and other public grievances. Traditional complaint methods like phone calls, physical visits to offices, or paper forms are time-consuming, inefficient, and lack transparency. There is no easy way for citizens to track the status of their complaints or communicate directly with the responsible authorities. This results in unresolved issues, citizen frustration, and poor governance.

Goal: To build a digital platform where citizens can register complaints online, track their status in real time, and communicate directly with assigned officers — making the grievance redressal process faster, transparent, and efficient.

Team Roles:

Role	Responsibility
Frontend Developer	Build UI using React.js, Bootstrap, Material UI
Backend Developer	Build REST API using Express.js and Node.js
Database Administrator	Design MongoDB schemas and manage data
UI/UX Designer	Design wireframes and user flows
Project Manager	Oversee timeline, phases, and submission

Step 2: Brainstorm, Idea Listing and Grouping

Group A — User Features (Citizen Side)

- Online complaint registration with form
- Upload image/evidence with complaint
- Real-time complaint status tracking
- Email/SMS notification on status change
- Chat with assigned agent directly
- View complaint history and past resolutions

- Filter complaints by category, department, urgency

Group B — Agent Features (Officer Side)

- View complaints assigned by admin
- Update complaint status (In Progress, Resolved)
- Add notes and upload resolution photos
- Chat with citizen directly
- View workload and assigned complaint count

Group C — Admin Features (Management Side)

- Monitor all complaints on dashboard
- Assign complaints to agents based on expertise
- Manage user and agent accounts
- View stats: total, pending, in progress, resolved
- Remove spam or misuse complaints
- Enforce platform policies and data privacy

Group D — Technical Features (System Side)

- JWT based secure authentication
- Role based access control (user, agent, admin)
- MongoDB for scalable data storage
- RESTful API with Express.js
- File upload support with Multer
- MVC architecture for clean code structure
- React Router for seamless navigation

Step 3: Idea Prioritization

Idea	Impact (1-5)	Effort (1-5)	Priority
User registration and login	5	2	High
Complaint submission form	5	3	High
Real-time status tracking	5	3	High
Admin dashboard with stats	5	3	High
Agent complaint management	5	3	High
Role based access control	5	3	High
Chat between user and agent	4	4	Medium
Image/evidence upload	4	3	Medium
Email/SMS notifications	3	4	Medium
Complaint filtering and search	3	3	Medium
Spam complaint detection	2	4	Low
Analytics and reports	2	5	Low

Selected Core Ideas for Development:

1. User registration, login and role based access
2. Complaint submission with image upload
3. Real time status tracking dashboard
4. Admin complaint assignment to agents
5. Agent status update and communication
6. Built-in chat between user and agent
