

Project Design Phase
Proposed Solution Template

Date	31 March 2026
Team ID	
Project Name	Online Complaint Registration and Management System
Maximum Marks	2 Marks

Proposed Solution Template:

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Traditional complaint systems are manual, time-consuming, and lack transparency. Users cannot easily track complaint status, and communication between citizens and authorities is inefficient. Complaints may be delayed or ignored due to lack of proper management.
2.	Idea / Solution description	The proposed system is a web-based Online Complaint Registration and Management System that allows users to register, log in, and submit complaints digitally. The system enables users to track complaint status in real time, upload supporting images, and communicate with agents. Admins manage users and assign complaints to agents, ensuring efficient resolution.
3.	Novelty / Uniqueness	The system integrates complaint submission, tracking, and management into a single platform with role-based access (User, Agent, Admin). It provides transparency through status tracking and improves efficiency using a centralized digital system. Optional real-time updates further enhance user experience.
4.	Social Impact / Customer Satisfaction	The system improves public service efficiency by reducing delays and increasing transparency. It enhances user satisfaction by providing easy access, real-time updates, and better communication with authorities. It also promotes accountability in complaint resolution.
5.	Business Model (Revenue Model)	The system can be used by government organizations or private institutions. Revenue can be generated through subscription-based services, licensing to organizations, or integration with premium support features.

6.	Scalability of the Solution	The system is scalable due to the use of modern technologies like React, Express.js, and MongoDB. It can handle a large number of users and complaints and can be extended with cloud deployment, real-time services, and additional modules in the future.
